

# Topanga Source ID Study

Presented to the Santa Monica Bay Restoration Commission

16 April 2015

# What we achieved...

1. Identified the sources of bacterial contamination at Topanga Beach
2. Identified BMP's that can reduce exceedances
3. Examined the sources and sinks, as well as trophic level interactions in Topanga Creek and lagoon to understand the Topanga "Magic"
4. Provided outreach to the local community and schools

# Thank you to the team!!

## **Our Funders: Supervisor Zev Yaroslavsky and SIPP**

**Los Angeles County Departments**

**State Parks Angeles District**

**Our TAC and SIPP Collaborators** for advice along the  
way

**BioSolutions and Topanga Underground**

**UCLA Team: Dr. Jenny Jay's Lab Group**

**Postdocs:** Dr. Tim Riedel, Vanessa Thulsiraj, Catalina  
Marambio-Jones

**Grad Students:** Amy Zimmer-Faust and Uriel Cobian

**Undergrads:** Robert Torres, Ian Davies, Flora Zepeda

# Drought Effects

**Topanga Rainfall**  
**Average – 25 inches**  
**2012 - 16.22 inches**  
**2013 - 9.99 inches**  
**2014 - 6.85 inches**  
**2015 – 11.18 inches**

Courtesy of Heal the Bay Beach Report Card

# A story with two parts:

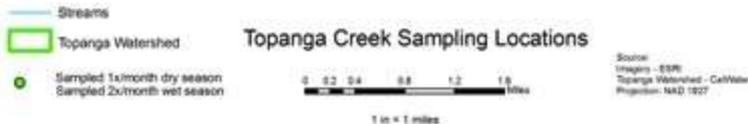

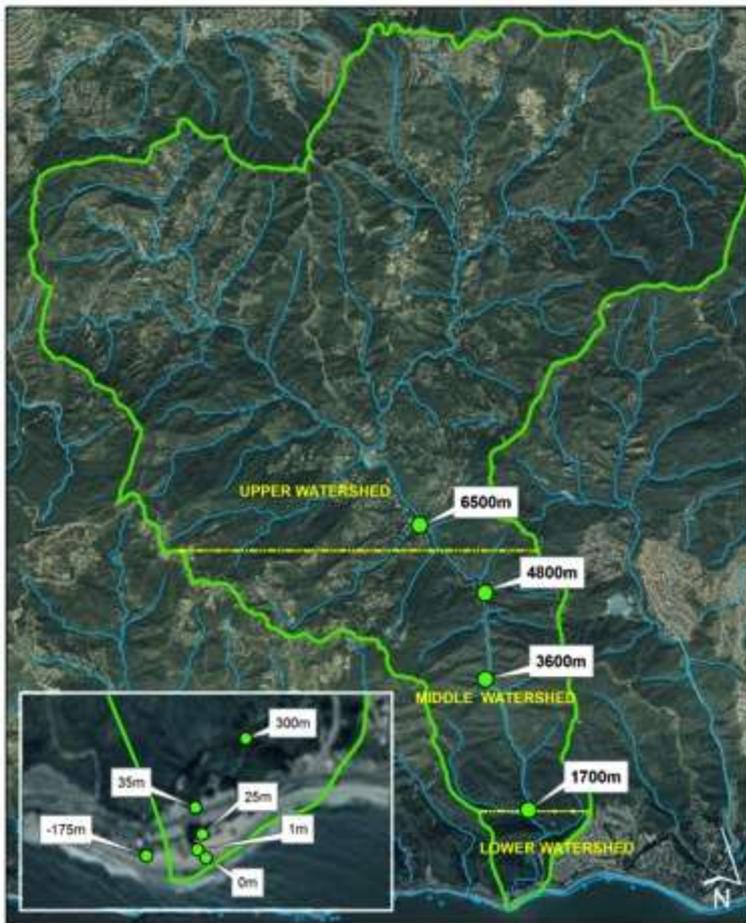

Upper watershed and creek

Lower watershed, lagoon and beach

# Topanga Creek Source Identification Sampling Sites 2012-2014

# Hypotheses tested

- Upper watershed FIB/nutrients not conveyed to the beach
- Concentrations of FIB/nutrients decrease as creek flows downstream
- Benthic macro-invertebrates (BMI) Index of Biotic Integrity increase as creek flows downstream

# TOPANGA CREEK RESULTS

Nutrient and In-situ Results

# Nutrients, Turbidity & Algae

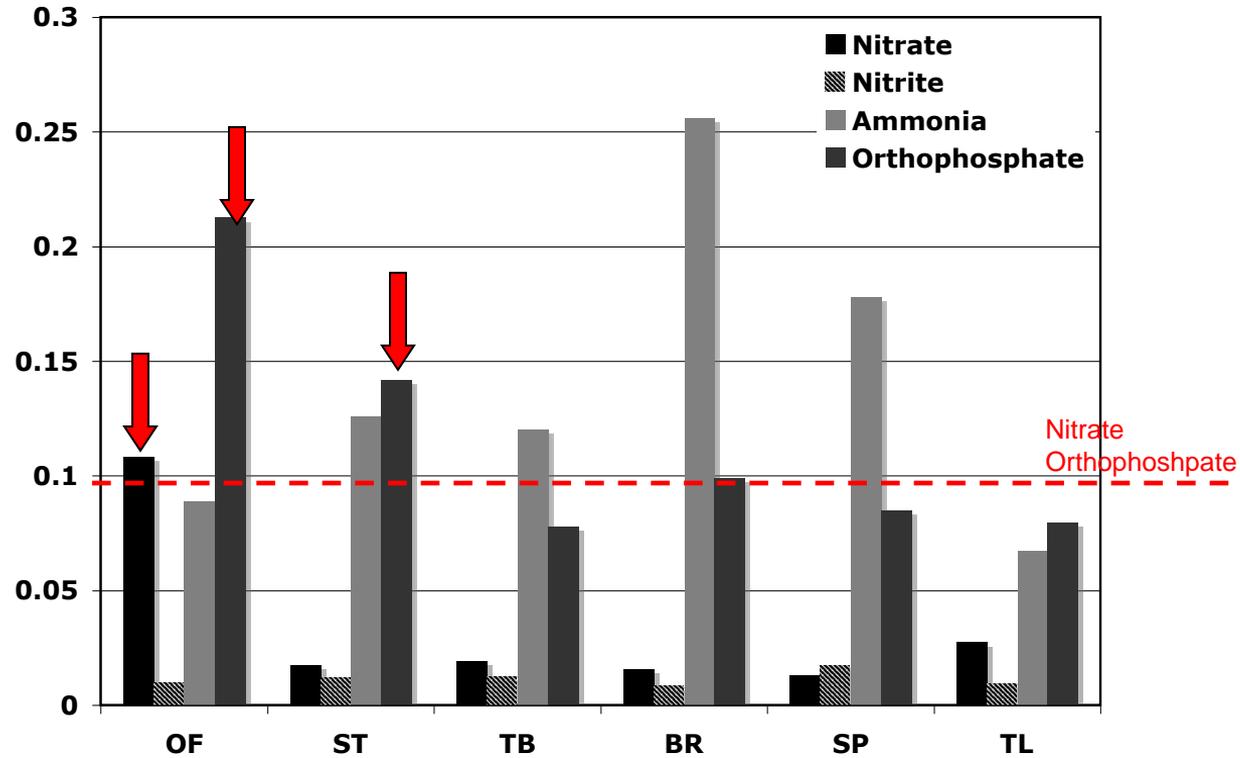

- Nitrate-N (ppm) >0.1
- Nitrite-N (ppm) >1
- Orthophosphate (ppm) >0.1
- Ammonia (ppm) >0.4
- Turbidity (NTU) >5
- Algae (% cover)

**Sites: TL, SP, BR, TB, ST, OF**

RCD Stream Team member, Gabe Sloggy,  
testing for nutrients, February 2013

## Average Nutrient Levels, Dec 2012-Aug 2014

# Physical Results

## pH

(Water Quality Objective: 6.5-9.0)

• Range: 7.1 (OF) – 8.44 (TL)

Highest mean: TL, BR, TB, ST (8.2)

Lowest mean: SP (7.6)

## Water Temperature (° C)

• Range: 6.0° C (BR) – 22.5° C (TL)

Highest mean: TL (16.3° C)

Lowest mean: BR (12.7° C)

## Dissolved Oxygen (mg/L)

(Water Quality Objective: >5 mg/L)

• Range: 1.4 (TL) – 11.8 (TL)

Highest mean: BR (8.2)

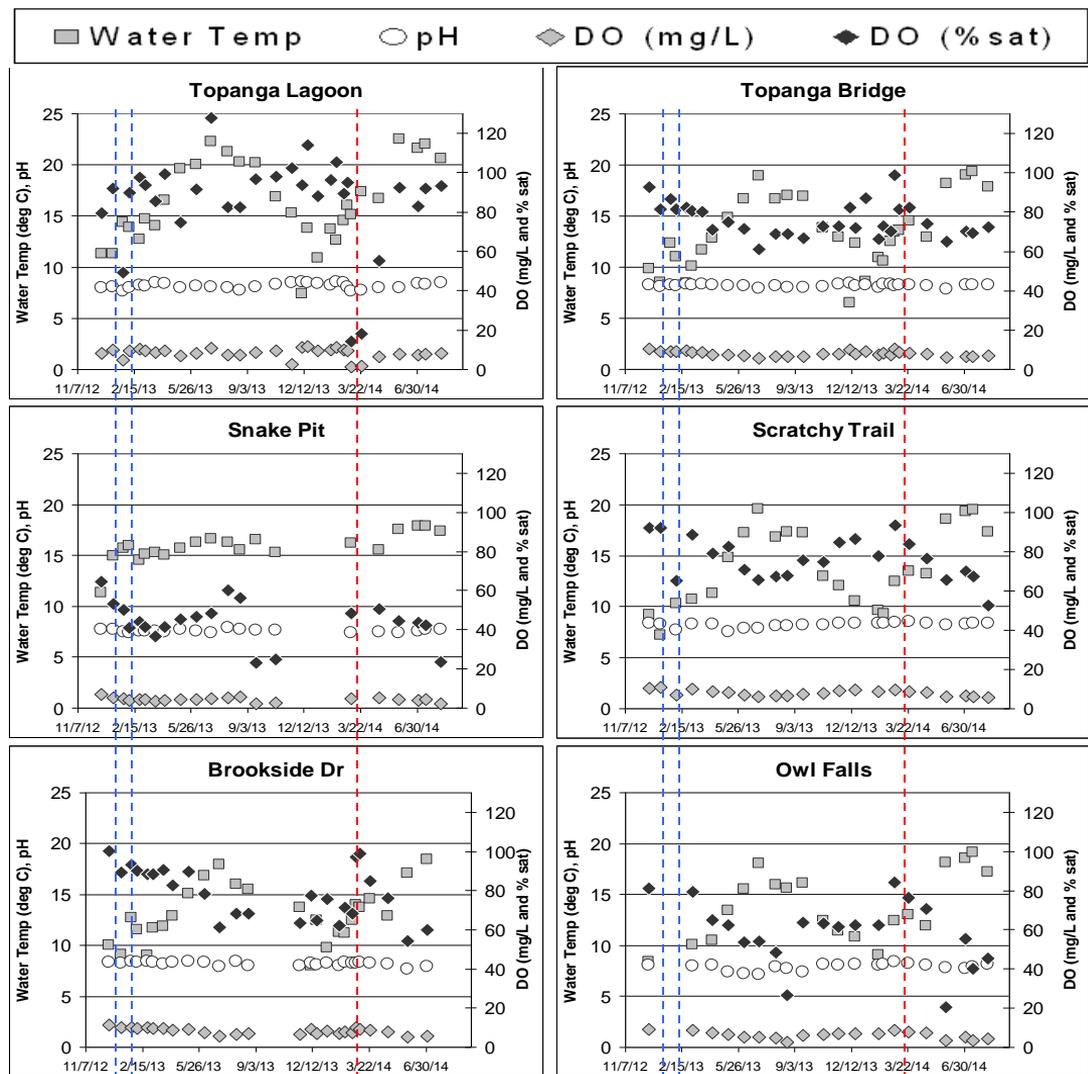

Lowest mean: SP (4.4)

## Dissolved Oxygen (%sat)

• Range: 14.2% (TL) – 127.7% (TL)

Highest mean: TL (85.5)

Lowest mean: SP (44.3)

# Spatial Correlations

- FIB often highly correlated with orthophosphate, nitrate, turbidity, and flow, especially upstream.
- The number of correlated variables decreased downstream.
- Across all sites, statistically significant correlations were:
  - EC: Ammonia ( $R^2=0.65$ ,  $p=0.002$ )
  - ENT: Ammonia ( $R^2=0.5$ ,  $p=0.01$ )
  - Nitrite: DO ( $R^2 = 0.60$ ,  $p=0.07$ ), such that sites with high levels of nitrite had low levels of DO.

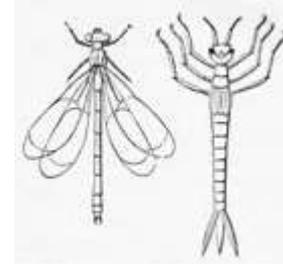

| Site               | Variable 1 | Variable 2 | Correlation Coefficient |
|--------------------|------------|------------|-------------------------|
| <b>TL (0 m)</b>    | turbidity  | phosphate  | 0.74                    |
| <b>SP (300 m)</b>  | DO mg/L    | turbidity  | 0.87                    |

# Source ID Key Findings (2013-2014)

\*2-fold relationship: BMI activity can release nutrients for microbes to eat, AND many BMI consume bacteria. (Covich 1999)

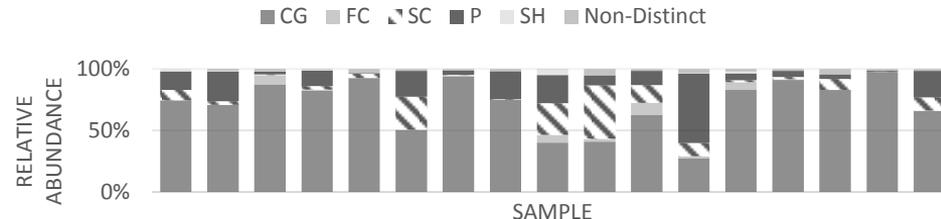

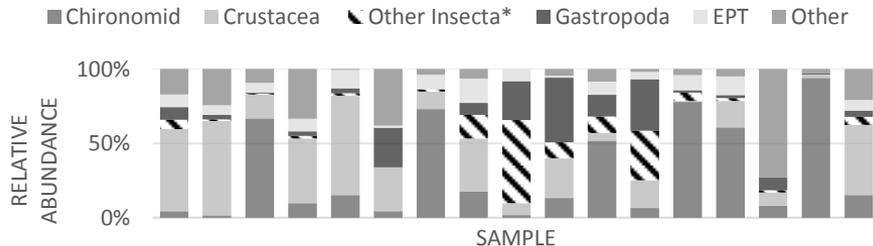

\*Van de Bund et al. (1994) found that higher densities of amphipods and chironomids increased the abundance of sediment bacteria.

## 1. SCC-IBI (Southern CA Coastal Index of Biotic Integrity)

- OF consistently scored lowest, ST the highest. *Proximity to development?*
- ⬆ average total coliform per site in 2014 = ⬇ total and EPT taxa SCC-IBI scores.
- ⬇ dissolved oxygen = ⬆ % non-insect taxa

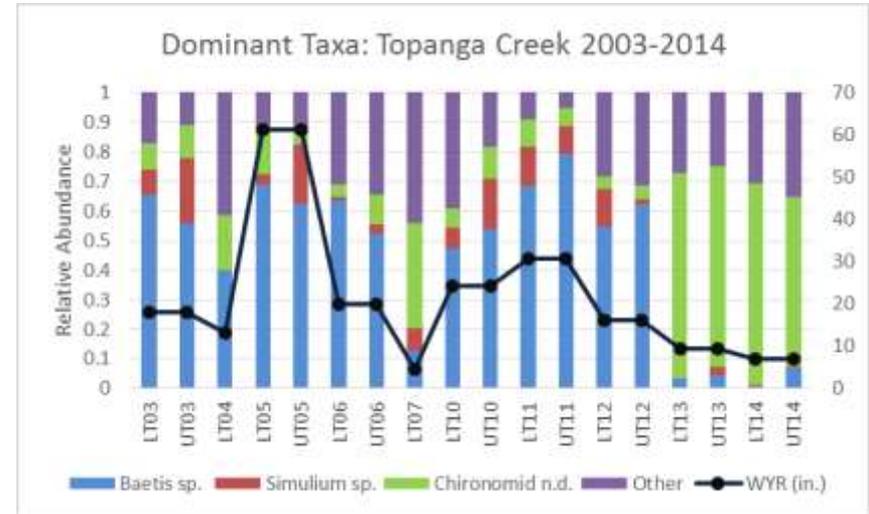

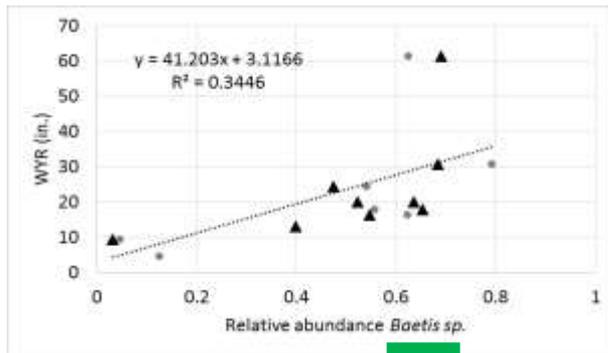

## 2. Species Composition

- Collector-gatherers were by far the most abundant
- FFG composition was more stable than taxa composition per site and over time
- High level of seasonal influence

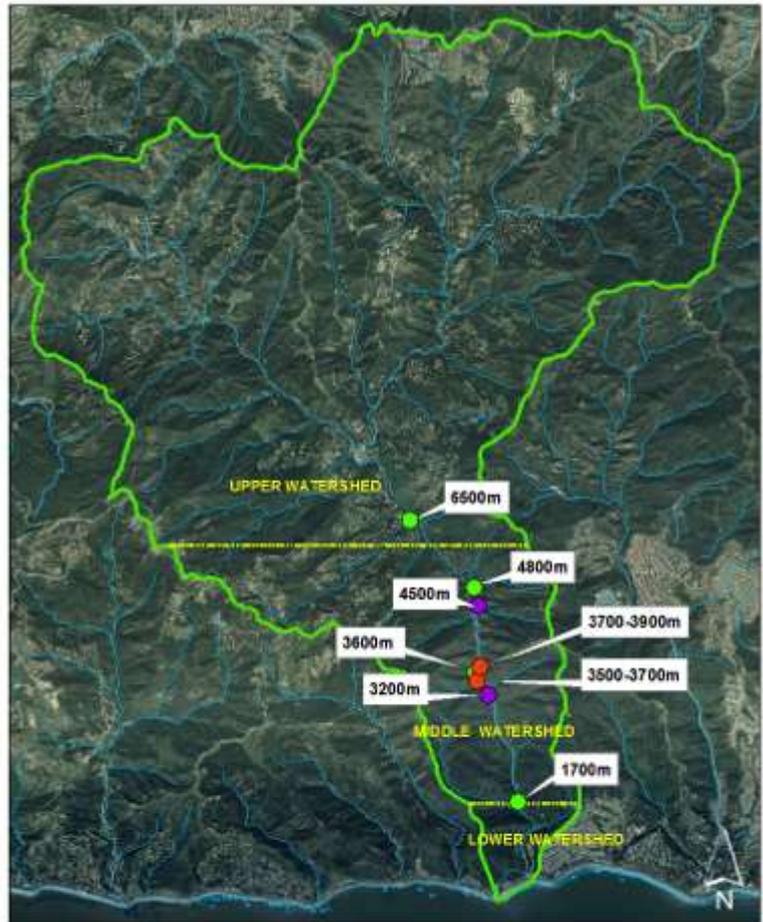

# Temporal and Regional Key Findings (2003-2014)

- Biotic integrity has been negatively affected by drought
  - Decreased SCC-IBI
  - Species composition shift
  - % intolerant increases with rainfall, % tolerant decreases ( $F < 0.05$ )
- Both high ( $>30''$ ) and low ( $<5''$ ) flow conditions resulted in disturbed BMI communities (Bray-Curtis).
- Regional comparison of Topanga Creek indicated relatively degraded conditions.
  - Still an important reference stream? YES

# Crayfish Problem

# Diatoms – Results

- 61/62 species in upper reach
- 64/66 in lower reach
- Shared 38-40 species
- 23/18 unique to upper, 26/23 unique to lower
- Most very pollution and disturbance tolerant
- Shell shape rapidly responds to changes in water quality

# Soft-bodied algae:

includes green, red and cyanobacteria

- Dominant species  
*Cladophora* and *Ulva*
- Lower reach had 3 additional species (13)  
upper reach had (10)
- *Cladophora* as eutrophication indicator? Maybe not?
- Cyanobacteria are nitrogen fixers found mostly in stream with low N levels

# Comparison of southern CA Periphyton IBI Indices

# Topanga Creek Food Web

conceptual model

# Trophic Level Interactions

- We hypothesize *P. clarkii* presence is leading to a trophic cascade resulting in a reduction in BMI biomass and species richness.

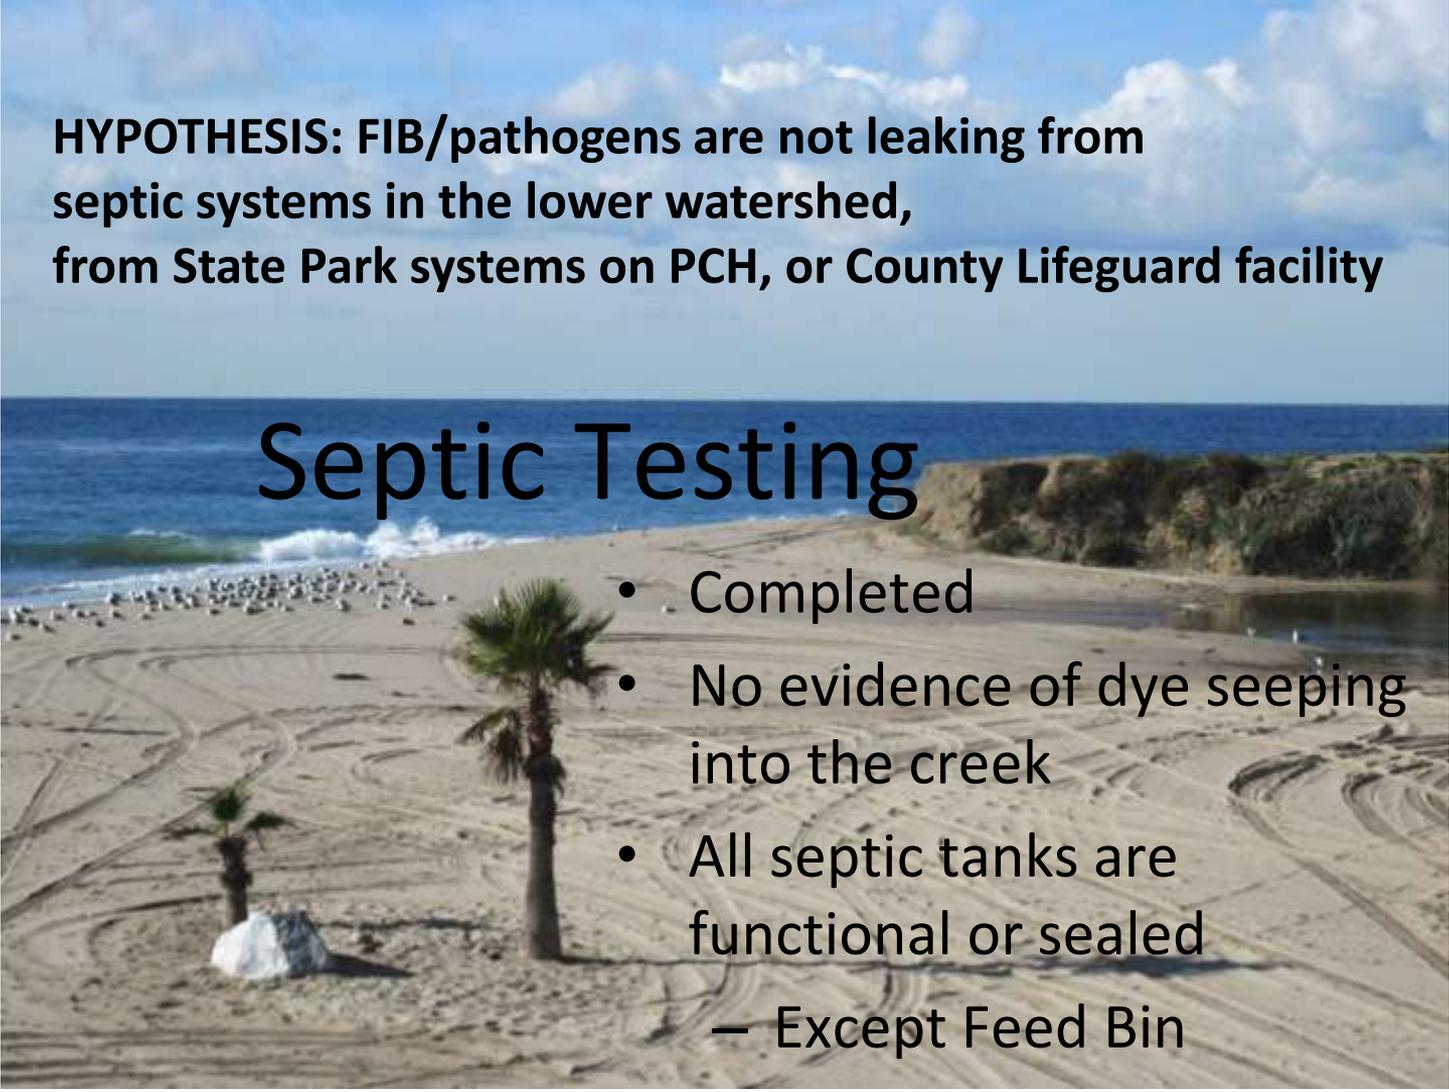

- More research is needed in trophic level interactions.

**HYPOTHESIS: FIB/pathogens are not leaking from septic systems in the lower watershed, from State Park systems on PCH, or County Lifeguard facility**

# Septic Testing

- Completed
- No evidence of dye seeping into the creek
- All septic tanks are functional or sealed
  - Except Feed Bin

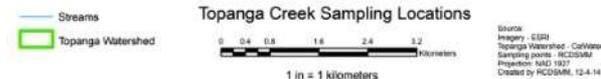

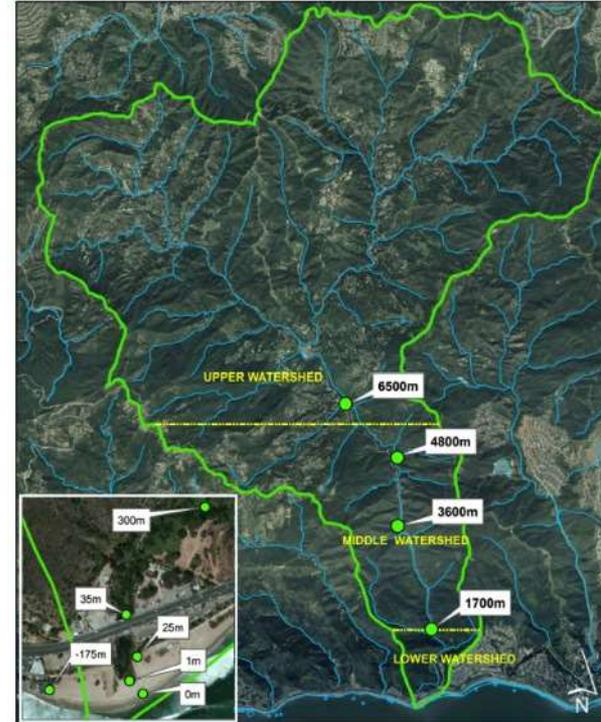

# First Flush Virus Testing

thanks to Dr. Jed Furhman Lab

- Results of samples collected during First Flush 27 Feb 2014
- Enteroviruses were not detected and all samples either negative, likely negative or inconclusively negative

# Topanga MST Study

- Two year microbial source tracking (MST) study initiated on the Topanga watershed.
- Need for MST in this watershed due to chronically high FIB levels in surfzone and unknown sources.
- New methods that allow for detection of host-associated fecal contamination applied to Topanga watershed.

## Hypotheses and Objectives

1. Lagoon discharge negatively impacts water quality at Topanga Beach (historical data analysis).
2. Upper watershed sources of FIB are not conveyed to lower watershed sites.
3. Spatial and temporal patterns of FIB and host-associated markers exist between sites in the lower watershed.

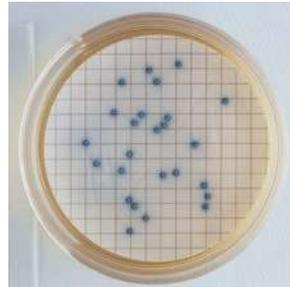

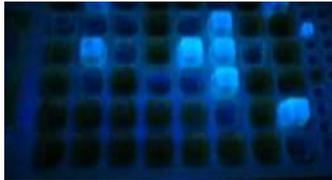

# Source ID Methods

## Culture-based methods: quantify fecal indicator bacteria:

- Enterolert (enterococci)- on all samples
- Colilert (Total coliform and *E.coli*)- on all samples

## DNA-based markers: target animal and human-sources of fecal contamination:

- Gull marker- all samples
- Dog marker- all samples
- Human marker-HF183 on all samples, Bachum was confirmatory
- Horse marker- selection of upper watershed sites and first flush samples

## MST FIB Results- All Sites Rain Events

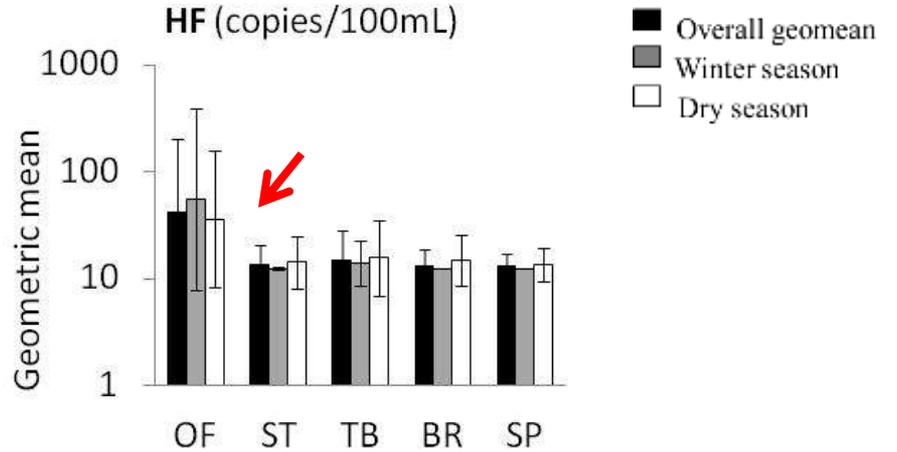

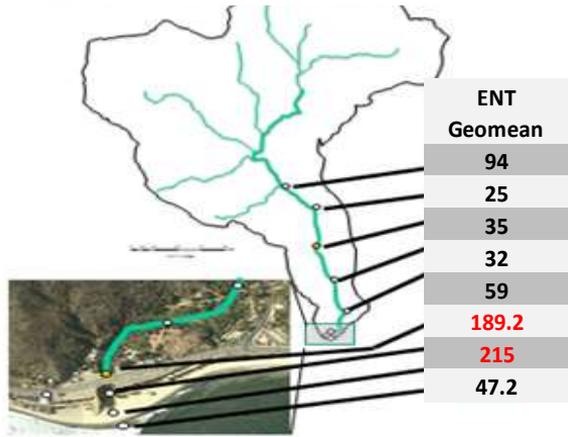

|                    | <b>TC</b><br>MPN/100ml       | <b>EC</b><br>MPN/100ml      | <b>ENT</b><br>MPN/100ml     | <b>HF</b><br>gene<br>copies/100<br>ml | <b>BH</b><br>gene<br>copies/100<br>ml | <b>Gull</b><br>gene<br>copies/100<br>ml | <b>Dog</b><br>gene<br>copies/100<br>ml |
|--------------------|------------------------------|-----------------------------|-----------------------------|---------------------------------------|---------------------------------------|---|--|
| <b>Raining</b>     | <b>3340.4</b><br><b>(50)</b> | <b>361.5</b><br><b>(51)</b> | <b>278.4</b><br><b>(59)</b> | <b>69.6</b><br><b>(51)</b>            | <b>324.2</b><br><b>(42)</b>           | <b>1082.0</b><br><b>(50)</b>            | <b>4007.1</b><br><b>(49)</b>           |
| <b>Not Raining</b> | 808.8<br>(364)               | 40.6<br>(364)               | 61.8<br>(379)               | 20.1<br>(376)                         | 57.1<br>(242)                         | 910.5<br>(377)                          | 430.0<br>(373)                         |

-Geometric means for all markers and FIB were higher in samples collected during active rainfall.

-Active rainfall increases the bacterial levels in the watershed, which is typical of other studies throughout southern California (Noble et al. 2003, Boehm et al. 2002, Surbeck et al. 2006).

# MST Results- Creek Sites

ENT Levels in Topanga watershed [MPN/100 mL]

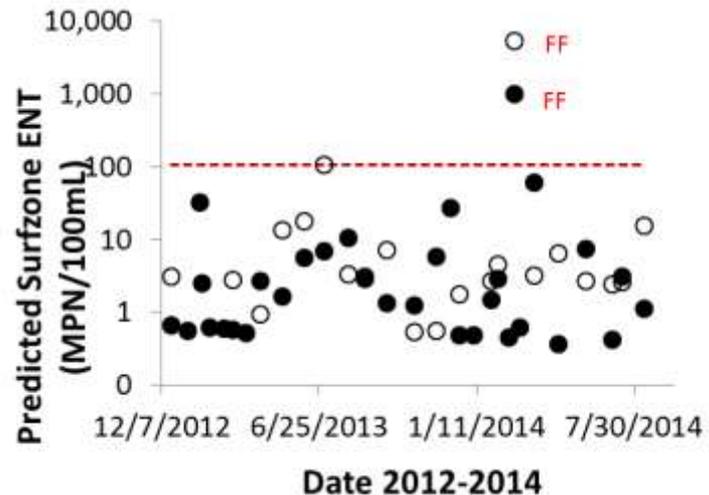

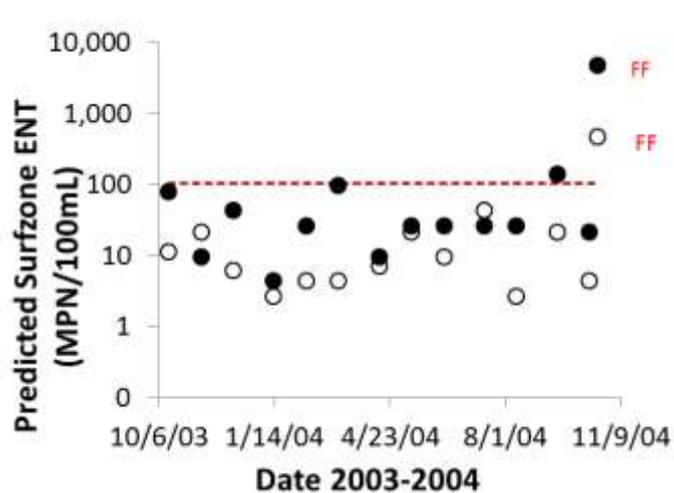

Frequency of marker detection at creek sites.

|       | OF  | ST | TB  | BR  | SP  | Creek |
|-------|-----|----|-----|-----|-----|-------|
| HF183 | 45% | 9% | 9%  | 4%  | 4%  | 13%   |
| Gull  | 5%  | 5% | 18% | 8%  | 23% | 13%   |
| Dog   | 14% | 5% | 12% | 13% | 22% | 13%   |

# MST Results- Creek Sites

## Predicted Surfzone FIB:

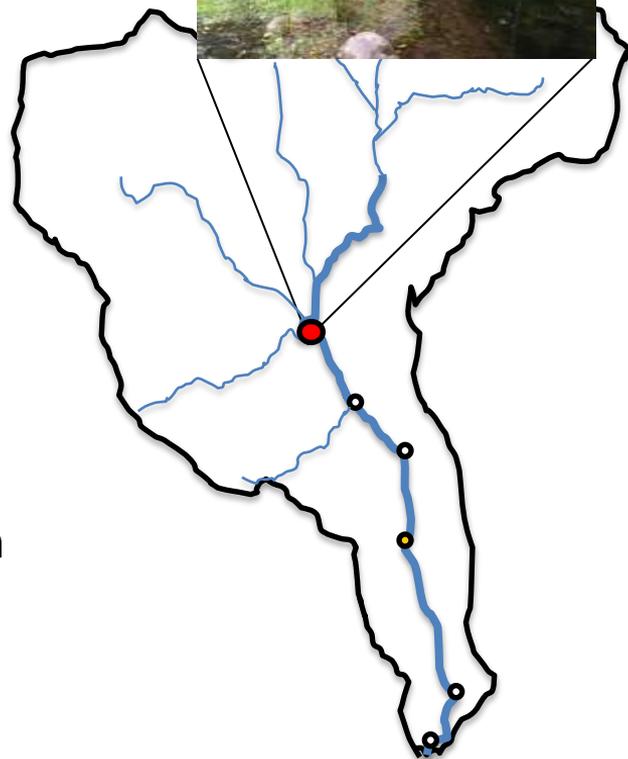

- Predicted surfzone FIB was calculated based on creek flow and creek FIB concentrations from the current study period (2012-2014) and from historical data taken between 2003-2004,
- Upstream creek sources do not appear to be a primary contributor to FIB in the surfzone, except on days when both flow and FIB levels in the upper watershed are elevated.

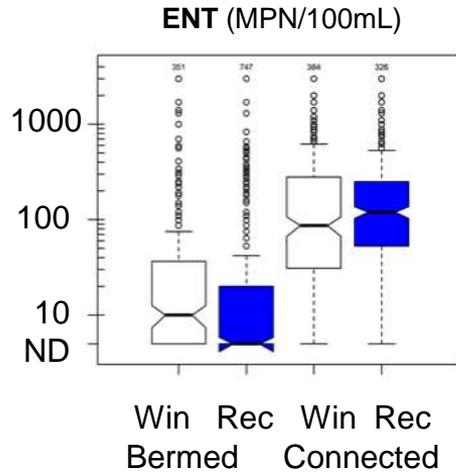

## MST Results- Creek

- Human marker detected frequently at OF but markers do not appear to be transported to downstream sites.
- Elevated FIB levels at OF quickly decrease and are not likely to affect lower watershed sites.
- Gull rarely detected in upstream creek sites.
- Dog detected infrequently- on average 13% in creek sites.

Owl Falls

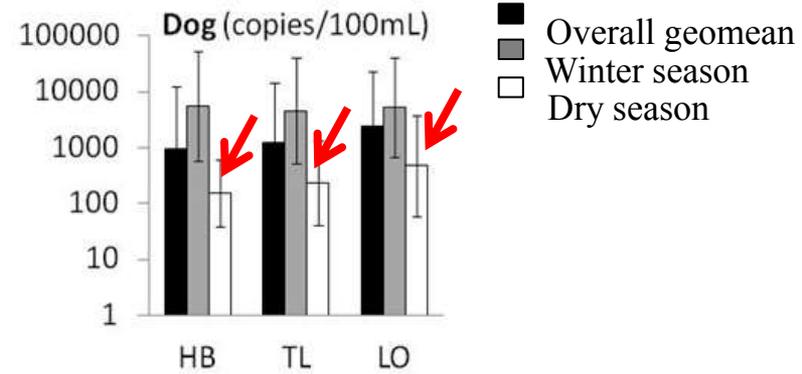

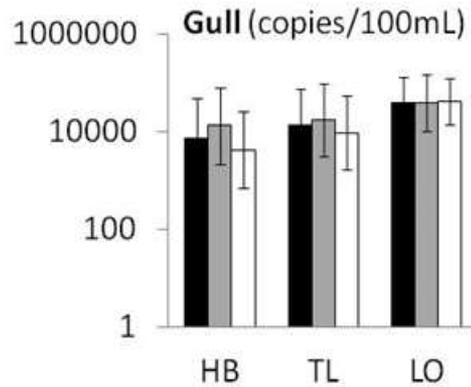

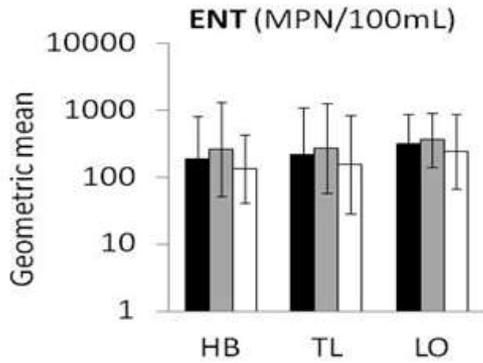

# Historical Lagoon and Beach Connection

- **Historical analysis of FIB recorded at Topanga Beach:**
  - FIB values recorded by Los Angeles Department of Public Health (LADPH) between January 2005 – November 2011
  - 1809 sampling events, approximately 6 days per week, Monday through Saturday.
  - Any note of flow was scored as “connected” and any note as ponded was scored as “bermed”.

# MST Results-Lagoon

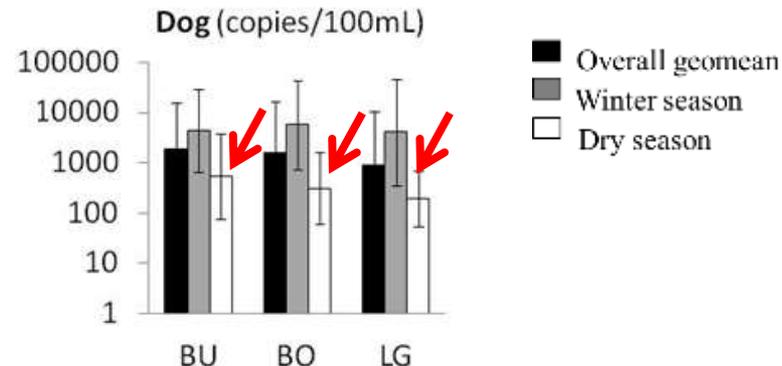

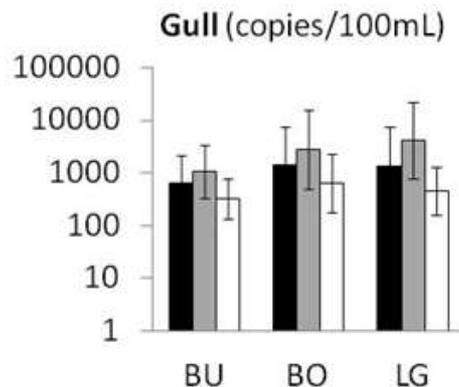

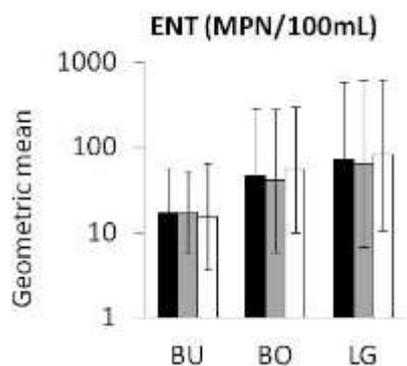

Frequency of marker detection at lagoon sites.

| Marker | Site |     |      | Total Lagoon |
|--------|------|-----|------|--------------|
|        | HB   | TL  | LO   |              |
| HF183  | 8%   | 17% | 20%  | 14%          |
| Gull   | 91%  | 95% | 100% | 94%          |
| Dog    | 58%  | 64% | 80%  | 64%          |

Frequency of exceedance of state single sample limits at TL.

| FIB | Site |
|-----|------|
|     | TL   |
| TC  | 33%  |
| EC  | 48%  |
| ENT | 75%  |

# MST Results-Ocean

Frequency of detection of MST markers at each ocean site.

| Marker | Site |     |     | Total Ocean |
|--------|------|-----|-----|-------------|
|        | BU   | BO  | LG  |             |
| HF183  | 12%  | 16% | 8%  | 13%         |
| Gull   | 76%  | 84% | 80% | 80%         |
| Dog    | 76%  | 74% | 58% | 71%         |

Frequency of exceedance of state single sample limits at each ocean site.

| FIB | Site |     |     |
|-----|------|-----|-----|
|     | BU   | BO  | LG  |
| TC  | 0%   | 5%  | 4%  |
| EC  | 0%   | 3%  | 4%  |
| ENT | 15%  | 26% | 28% |

# Dog Marker Survey

## Reference beaches (Malibu and Dockweiler):

- Negative for Dog marker in samples

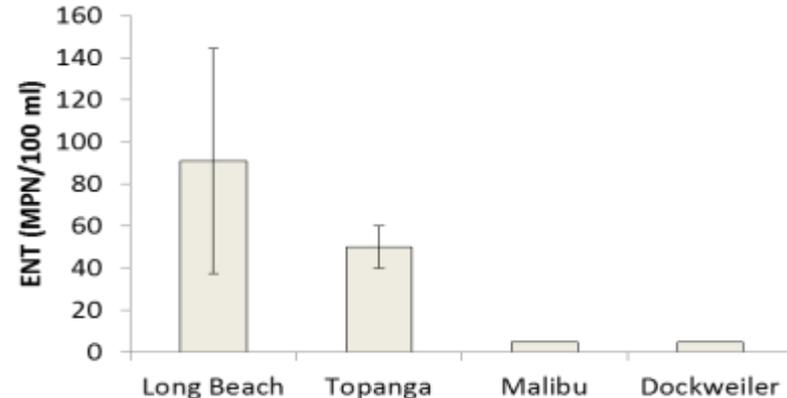

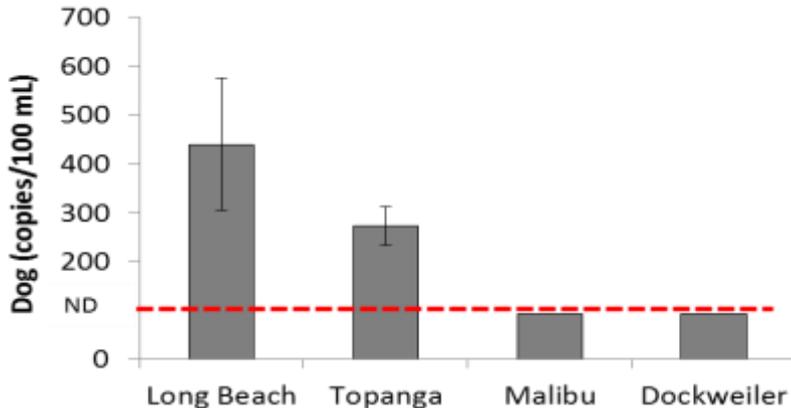

## Rosie's Dog Beach (Long Beach, CA):

- Water samples: 219 – 823 copies/100 ml
- Sediment: all negative for dog marker

## Topanga Beach

- Water samples: 193 – 334 copies/100 ml
- Sediment samples: BO – 205 copies/g, BU -167 copies/g

## MST Results- Lagoon

- Based on historical data, breaching events lead to elevated FIB in the surfzone.
- Consistent dog and gull marker detection throughout the lagoon.
  - Seasonal trend of dog marker
- Little spatial variability between lagoon sites for FIB and marker levels.
- Frequency of human marker detection was 14% for all samples.

## MST Results- Ocean

- Consistent dog and gull marker detection at the three ocean sites.
  - Seasonal trend for dog marker.
- Compared to lagoon → BO had significantly lower levels of all markers and FIB, except for dog marker.
- Little spatial variability between BO and LG ocean sites for FIB.
  - BU had lower levels of ENT than BO and LG.
- Frequency of human marker detection was 14% for all ocean samples collected.

## Topanga MST Summary

- Historical analysis confirms importance of lagoon breaching event on elevated FIB in the surfzone.
- FIB in the surfzone do not originate from an upstream creek source.
- Dog and gull were important fecal sources to surfzone.
- Human marker hits were less frequent, but still may be considered a potential source.

# WHAT CAN WE DO TO REDUCE EXCEEDANCES?

RESTORE Topanga Lagoon

REDUCE inputs into the upper watershed, along the creek and at Topanga Lagoon

RESTRICT ACCESS to the main stem of the creek and protect from increasing impacts from park visitors, taggers, transients and marijuana farms

MAINTAIN septic systems along the beach

COMMUNITY OUTREACH AND EDUCATION KEY!

---

# Topanga Community Outreach

## POSTER CONTEST

Help keep Topanga Beach clean and win a pillow pet!

Did you know that pets are not allowed at Topanga Beach? Many people use this beach for swimming, surfing, and relaxing in the sand. The Topanga Creek lagoon is an important resource for birds and fish. Animal feces carry bacteria that can be harmful to humans and wildlife. Help spread the word by submitting your poster today!

### Contest Rules:

- ★ Posters should be 2 ft x 3 ft and explain why it is important to keep our beaches clean!
- ★ Posters need to include "no dogs, cats, horses or other animals are allowed on any of the Los Angeles County Beaches (County Code sections 17.12.290 and 17.12.300)."
- ★ Posters should be submitted to the RCDSMM ([info@rcdsmm.org](mailto:info@rcdsmm.org)), or to the Topanga Library by 5pm Tuesday 27 May. Student name, phone # and email should be included on the back.
- ★ Reps. from Supervisor Yaroslavsky's office, County Department of Beaches and Harbors, and Topanga Town Council will select the winning posters on 28 May.
- ★ Prizes will go to the top 3 posters selected and the top poster will be mounted at Topanga Beach.

San Yaroslavsky  
Los Angeles County  
Supervisor

- Keeping pets off the beach
- Cleaning our creek
- Removing invasives
- And planting oaks

**WHAT:** The Resource Conservation District of the Santa Monica Mountains and the Watershed Stewards Project are hosting a non-native plant removal and trash pick-up event along Topanga creek! We will be contributing to the continued restoration of 12 acres in and around Lower Topanga Creek. Let's help the creek return and celebrate Earth Day! Volunteers will receive free admission to the Topanga Earth Day Festival!

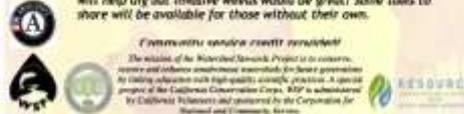

**WHEN:** Saturday April 19th, 2014 from 9:00 a.m. to 1:00 p.m.

**WHERE:** Meet at the entrance gate on Topanga Canyon Blvd, located on the south bound side, approximately 500 yards up from the intersection with Pacific Coast Highway. Park along the shoulder of Topanga Canyon Blvd. or at the Topanga Ranch Motel.

**WHO:** You, your friends, neighbors, and family! People of all ages and abilities are welcome. Please leave furry friends at home... Woof!

**P. S.:** Please wear closed toe shoes and long pants. Bringing work gloves and tools like loppers for removing Arundo, crowns or hoes that will help dig out invasive weeds would be great! Some tools to share will be available for those without their own.

*Environmental cleanup events provided*  
The mission of the Watershed Stewards Project is to conserve, restore and enhance riparian/watershed ecosystems for future generations. An ongoing education and high quality scientific research. A special project of the California Conservation Corps. RSP is administered by California Institutions and supported by the Corporation for National and Community Service.

# Topanga Elementary and Mountain School

## Outreach and Field Trips 2013-2014

- 2 in-school presentations

Content: Topanga Creek Watershed ecology, source ID study, pH activity, field trip prep.

- Field Trip to Topanga Beach

Activities: test WQ, seine lagoon, sediment sampling, bacteria cultures, macroinvertebrates, crayfish

- Water Quality Program @ UCLA

# Student scientists collect data

# The dog problem.....

# Poster Contest Winners 2014

# Winning Posters at Topanga Beach

# BMP' S

Implement BASIN PLAN RECOMMENDATIONS

Implement North Santa Monica Bay Coastal Watersheds monitoring program at Topanga Bridge

Community outreach needed – what are the best way to reduce inputs in upper watershed

Community meeting update on info gathered – November 2014?

Pet and corralled animal inputs- formal outreach? How?  
When? Target audience?  
Trailhead notification of dog inputs?

Explore the possibility of site specific standards with further testing.
